Meaning of a Computer:

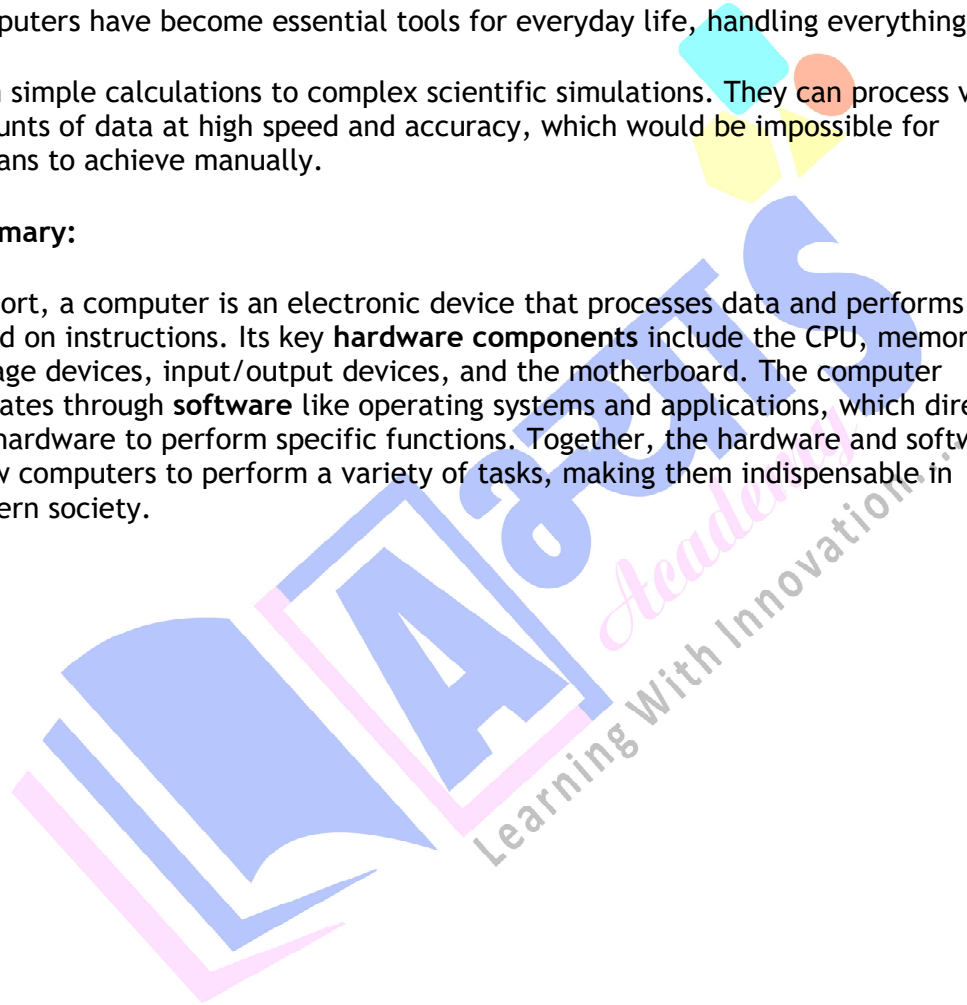

A **computer** is an electronic device that is capable of performing a wide range of tasks, such as storing, retrieving, processing, and transmitting data. It follows instructions (or programs) to execute various functions and solve problems. Computers are used in many fields, including education, business, science, entertainment, and communication.

Computers have become essential tools for everyday life, handling everything

from simple calculations to complex scientific simulations. They can process vast amounts of data at high speed and accuracy, which would be impossible for humans to achieve manually.

Summary:

In short, a computer is an electronic device that processes data and performs tasks based on instructions. Its key **hardware components** include the CPU, memory, storage devices, input/output devices, and the motherboard. The computer operates through **software** like operating systems and applications, which direct the hardware to perform specific functions. Together, the hardware and software allow computers to perform a variety of tasks, making them indispensable in modern society.
