Self-Made Assignment - Introduction to Web Development

Components in Web Development

To solve these True/False questions in a Microsoft Word file,

1. HTML is the standard markup language used to create web pages.
2. CSS is responsible for adding interactivity and dynamic behavior to a web page.
3. JavaScript allows content on a webpage to change without reloading the page.
4. HTML elements define the structure of a webpage.
5. CSS works independently of HTML and is not used in web development.
6. JavaScript code runs inside the web browser.
7. A single external CSS file can be linked to multiple HTML pages.
8. PHP code is executed in the browser like JavaScript.
9. PHP can collect form data and manage cookies.
10. Python can be used to develop web applications and handle databases.
11. The file extension for PHP files is .php.
12. Python cannot run on macOS or Linux systems.
13. HTML, CSS, and JavaScript together form the foundation of a web page.
14. CSS helps create responsive designs that adapt to different screen sizes.
15. JavaScript is only used on the backend and not on the frontend.
